

myMCS System Integrator

Connect your data

As a company you want to react quickly to new developments. This depends to a large extent on your ability to turn strategic business insight into efficient operational policies. In order to succeed in this goal, it is crucial that information is shared throughout your organization, between departments, IT systems and people.

An organization – wide approach, and not separate policies, will offer you the greatest added value. This demands a powerful and flexible software platform giving you the power to quickly respond to market demands or new business processes.

myMCS System Integrator provides you with such a platform. It allows you to seamlessly integrate myMCS with already existing IT systems in your organization. The term 'integration' should be understood in its broadest sense: between management information systems from the same supplier, from different suppliers, with financial applications (SAP), HR systems (PeopleSoft), Building Management Systems (Siemens Desigo) and many more.

Consequently data is shared between different IT applications, instead of duplicating them. If you e.g. create a room in myMCS, this location will be automatically visible in SAP. Vice versa, if a room is added in SAP, it will appear in myMCS geographical tree structure (Control Center). This makes double entry redundant. It guarantees consistency and increases reliability, for myMCS as well as other systems.

An interface offers a significant added value as you only need to enter or edit data in the application of your choice, It also enables you to search for information about locations, personnel data, helpdesk tickets, financial data ... without hassles.

This exchange can be bi-directional. Tickets from an external helpdesk application are automatically booked in myMCS, without any manual intervention(s) in the myMCS system. The status of these tickets is fed back into the external helpdesk application. This way both systems can benefit from a maximum added value through this flow connector.

Obviously this also works the other way around. Consolidated data directly impacts your organization beneficially. It doesn't

only increase the operational readiness, but it also substantially improves reporting possibilities. After all, in many companies, a management information system plays a central role in controlling the organization. Thanks to the myMCS System Integrator you will benefit from an open software environment, that allows the accelerated realization of interfaces between different information systems, under which myMCS.

Thanks to this standard information exchange platform, integrations no longer start from scratch. Since an important part of the thinking has already been done, interfaces are efficiently implemented, without wasting time.

From a technical point of view this platform is an API (Application Programming Interface) that uses web services based on the SOAP-protocol via HTTP/HTTPS. With this API, MCS or its customers are able to quickly build an interface.

Our vision of 'integrating' instead of 'linking' is a central theme in our software solution. This already resulted in a unique integration between data and floor plans (myMCS Drawing Interface), a certified SAP integration, many HRM integrations (e.g. PeopleSoft), integrations with building management systems (standard Siemens Desigo & Honeywell BMS), etc.

myMCS System Integrator centralizes all the experience gained. With this proven technology you are sure to have a reliable data transfer between your software applications.
